

Waste Water Filtration Unit

The CESCO Wastewater Filtration Unit (WWT) is designed to remove hazardous metals from the waste stream prior to recirculation back to the Aqua Miser or to sewer discharge.

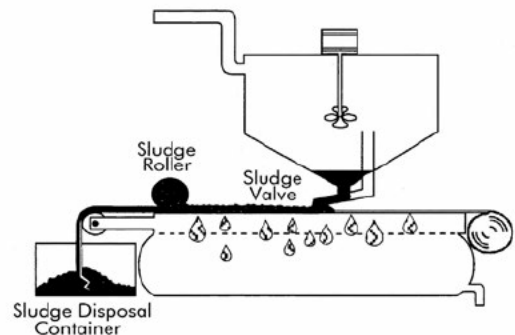

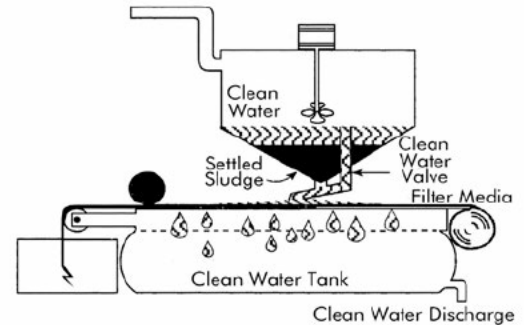

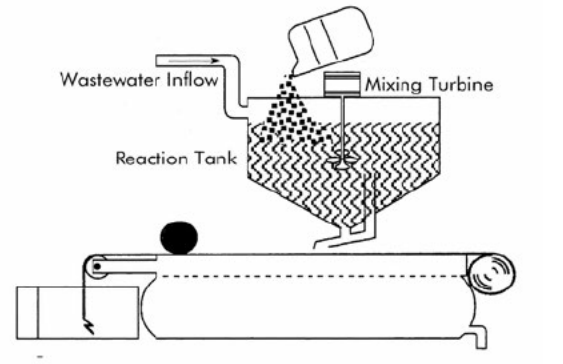

Wastewater Filtration Unit Model BBC - 10 - 15 - 3 - WWT

Using gravity filtration, solids are removed from the liquid as the wastewater passes through an automatic indexing fabric filter. The filtered water is stored in the bottom tank while used filter fabric and solids are advanced into the waste hopper for disposal.

The WWT Wastewater Filtration System is capable of processing 300 gallon per hour of wastewater. The system will continue to process wastewater until the bottom tank is full.

The BBC-10-15-3-WWT is capable of running continuously and automatically with a minimum amount of maintenance.

Dimensions: 112"L x 60"W x 110"H
